

Embedded World 2019 Press Release - February 2019

In partnership with Twin Oaks Computing Inc, Hamersham has cultivated an enviable reputation in the global DDS market. We are a leading provider of software tools and middleware implementations all supported by fast and responsive customer service. We offer a complete, bespoke software solution, from DDS licensing and system integration to sales, technical support and maintenance throughout many diverse markets.

Middleware is now an essential requirement for applications that have complex networking requirements. Complex networking requirements occur in highly dynamic systems where:

- It is not possible to have a central message broker. Participants have to exchange data P2P.
- Networks have to scale automatically. Thousands of devices have to be able to join and leave the network automatically.
- Flexible communication profiles have to be able to be called on to enable network users to define when, where and how data is received.
- A comprehensive encryption and authentication security layer is required.
- A small foot print middleware (35K LOC) is required for devices where there are minimal resources available.

Our wide range of field experience now puts Hamersham in a unique position to satisfy every requirement for a successful DDS experience. Please visit our stand, see the live DDS demonstration and understand how DDS can work in your application.
