

## HAINZL presents compact touch panel with radio connection

HAINZL now offers a 4.3" touch panel with numerous interface functions. This means, for example, that devices and machines from home, building or energy technology are now operable via a modern user interface such as smartphones and the like. The new displays are available both in a housing suitable for wall mounting or in an open frame version for OEM series applications.

Especially the compact dimensions with the 4.3" multitouch colour display is making the new HAINZL control unit attractive for many industries.

The panel is equipped with Enocean radio, with which a multiplicity of radio sensors and actuators can be attached. In addition, two Ethernet ports and an RS485 interface are available for integration into higher-level control systems. A powerful Linux engine operates in the control panel, which can also perform control tasks.

With the HAINZL basic software package, users can create their own individually designed user interface or software application. Optionally, HAINZL software specialists can also create the software application according to the customer's specifications.

The operating panel can also serve as a PLC replacement. A CoDeSys implementation is available.
